

Growing Deep-Topsoil, Clean-Water Watersheds: The Monitoring BMP to Grow Vermont's Base-Infrastructure

Abe Collins
LandStream

(802) 782-1883 abenewsoil@gmail.com

Healthy, covered, aggregated topsoil:
the root source of clean water and flooding regulation.

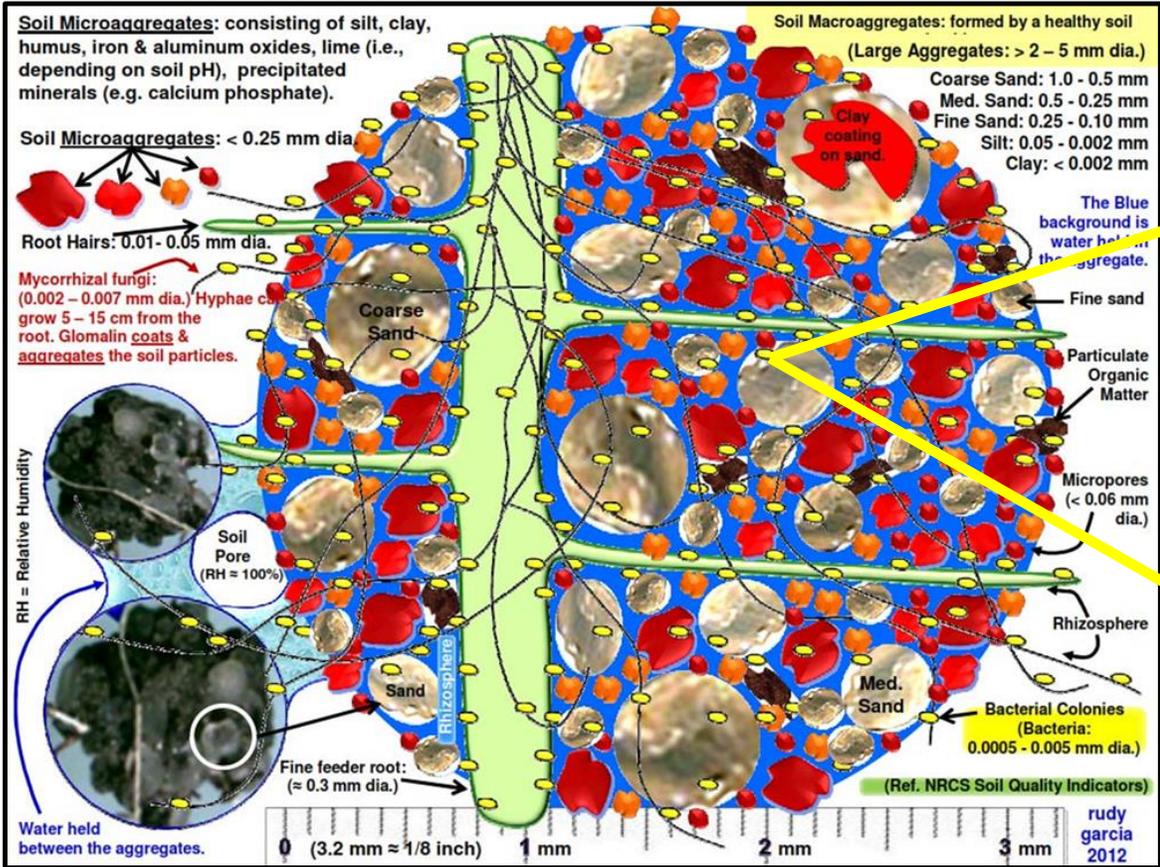

Grow Topsoil to Grow Clean Water

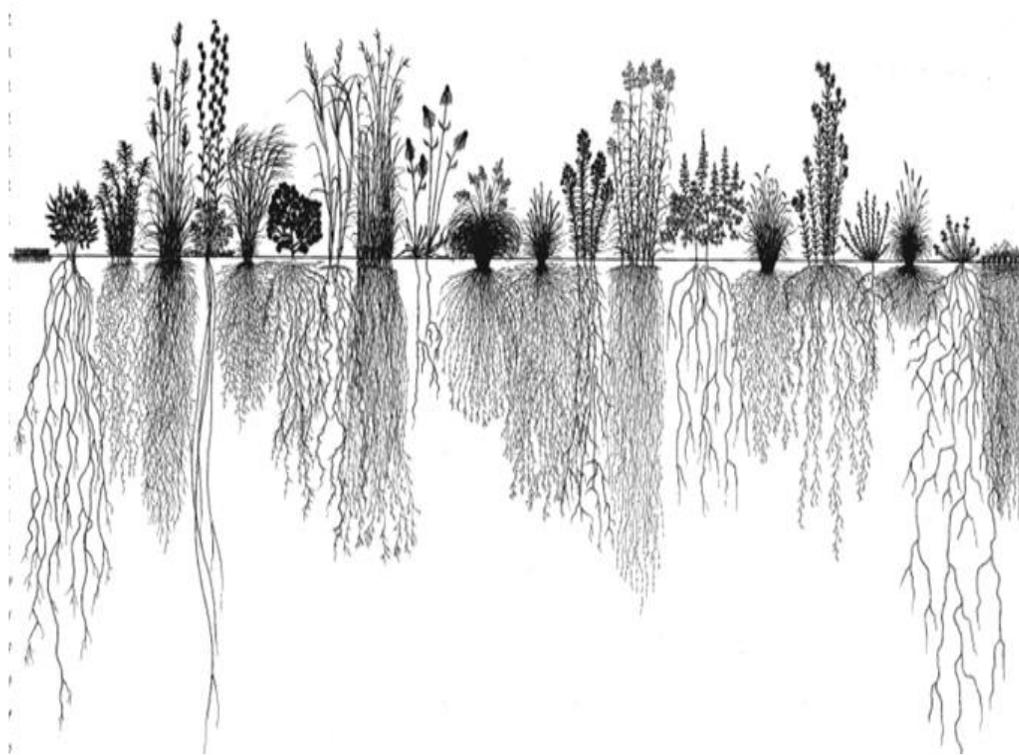

- "Every era has been shaped by its response to the great water challenge of its time....those societies that find the most innovative responses to the crisis are most likely to come out as winners."
- *Steven Solomon, Water - The Epic Struggle for Wealth, Power and Civilization*

The soil aggregate is the fundamental unit of infrastructure.

The Living Landscape Sponge

Infiltrate, Hold, Purify, Slowly Release

Who can grow new topsoil and clean water?
Farmers.

What do we need to grow new topsoil and clean water?

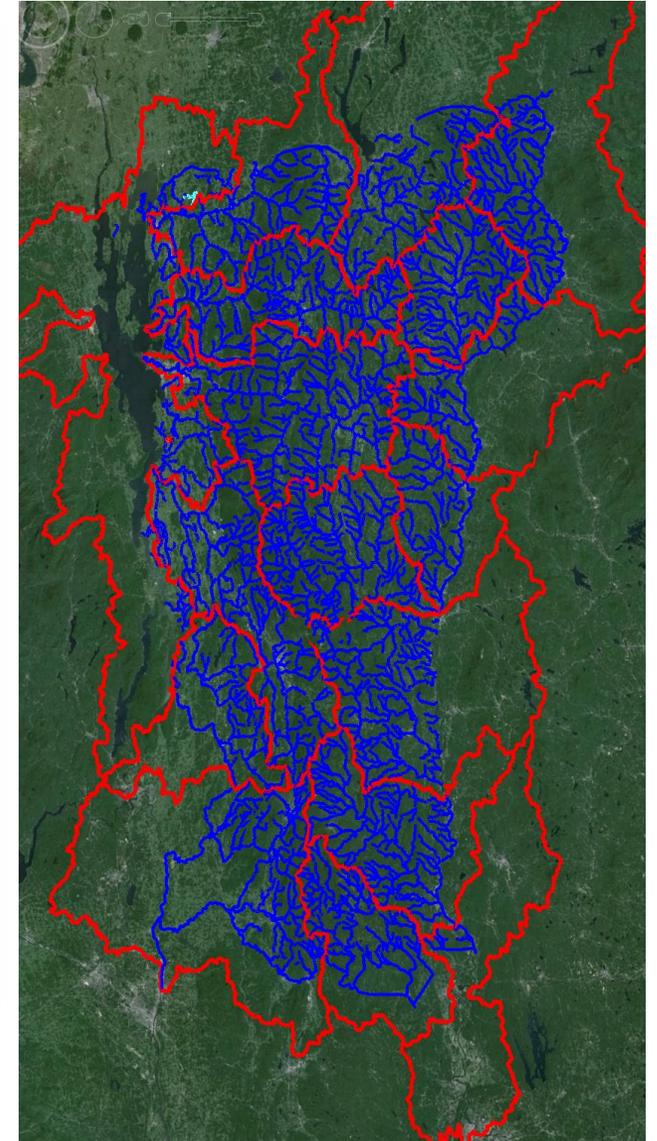

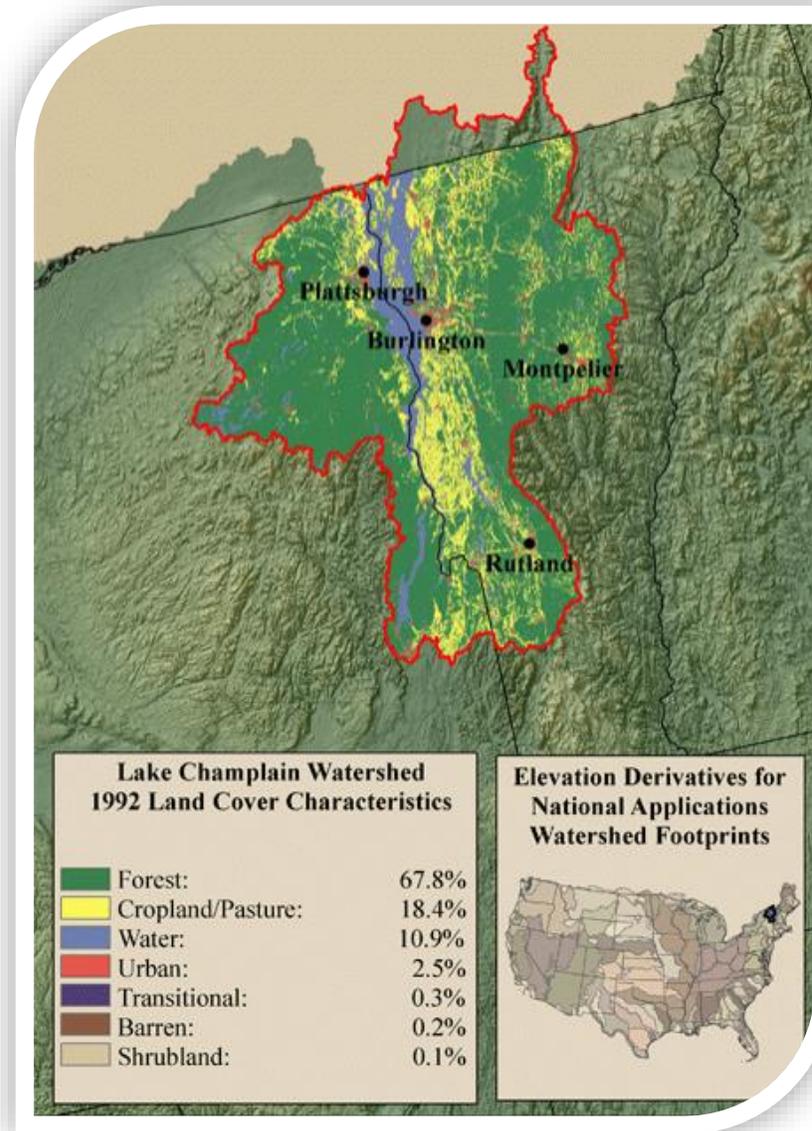

Growing a 16X Reduction in Runoff

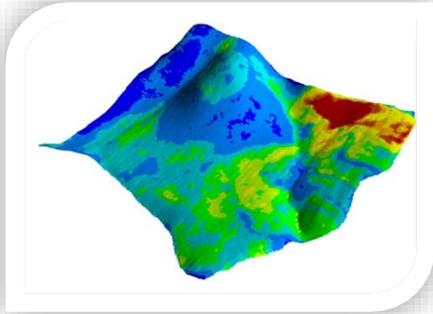

- Gabe Brown's 4,000 acre farm in North Dakota:
 - 265% increase in organic matter in 11 years
 - 16-fold increase in water infiltration: $\frac{1}{2}$ " /hour to 8"/hour
 - 13.6" of rain in 22 hours: little runoff, zero erosion
 - 0-10% fertilizer use of the county average
 - 0-25% herbicide use of the county average
 - 117 bushel corn yield compared to 70 bushel county average

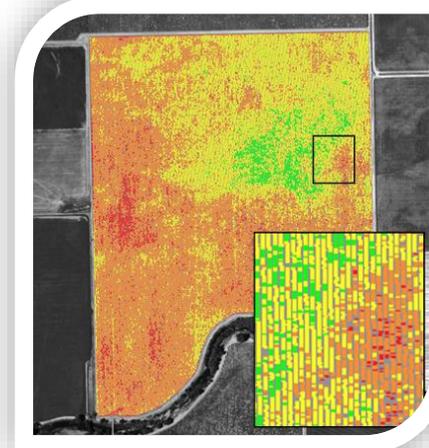

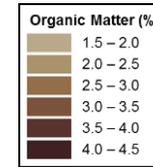

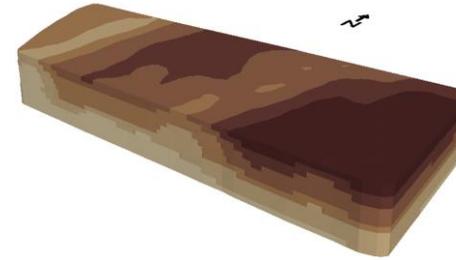

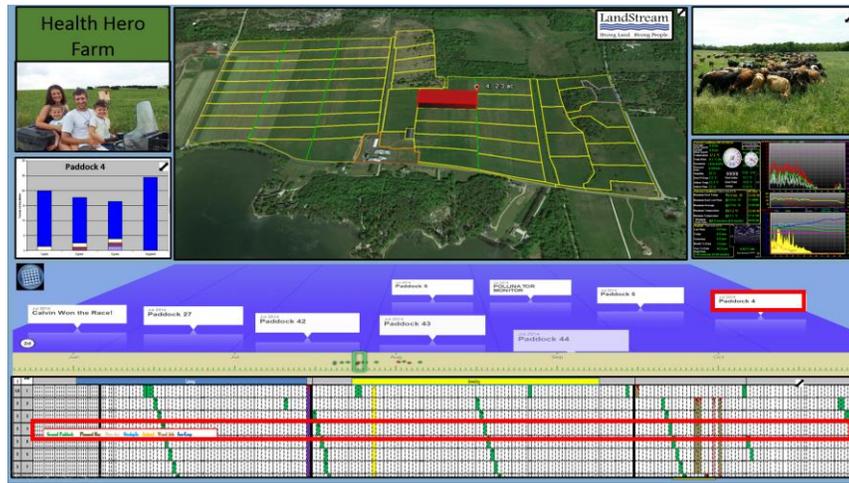

~ 5.3 million acres total
~ 1 million acres of agriculture

Can we grow deep-topsoil, water-secure watersheds in a decade?

Clean Water as A Crop

- Forbes: The \$8 Billion Bargain: How Watershed Payments Save Cities, Support Farms And Combat Climate Change

NYC and the Catskill Watershed

“Watershed communities have to be your partner in protecting the system, and there’s no amount of mechanical systems or science that’s going to protect the water unless people in the watershed are your partner in protecting it.”
Marilyn Garber, Commissioner, NYC Department of Environmental Protection

“We’ve become a water-exporting region.” *Alan Rosa, Director, Catskill Watershed Corporation*

“More than 140 US cities are considering watershed conservation instead of building filtration plants.”

Two Perspectives, Two Futures

Topsoil is non-renewable

Conserve what's left.
Continually solve the
problems that are symptoms
of degraded soil.

Reduce P/N loading. Reduce
erosion. Clean up after
floods.

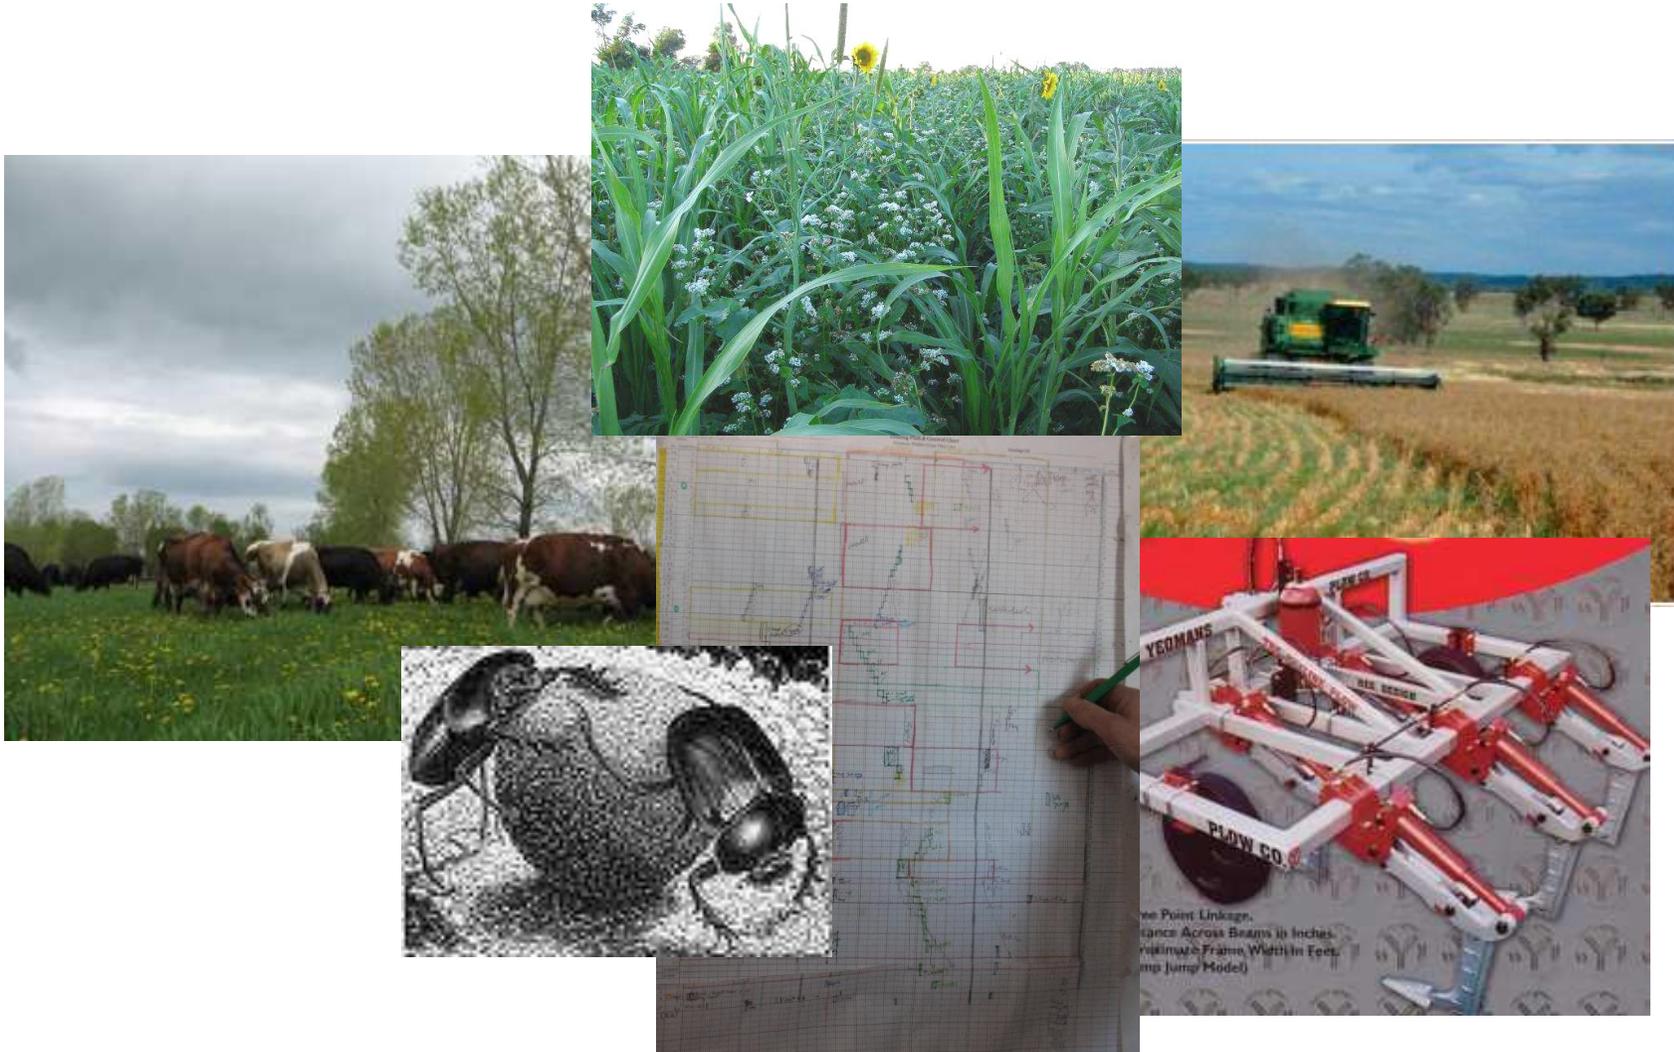

Topsoil is renewable

Grow new topsoil in our
watersheds. Support the
soil-growers. Monitor to
complete the feedback loop.
Be creative. Cooperate. Get
to work.

Growing Clean Water: 4 VT Feedback Farms Pilot

- Goal: Develop pilot examples of affordable, distributed farm monitoring as a Best Management Practice for achieving watershed health.
- A pilot to support and further enable four VT leadership farms in:
 - creating improved soil conditions that yield watershed environmental security,
 - improving the economics of production
 - demonstrating the economics of growing clean water as a crop at farm/watershed scales
 - developing tools that provide performance metrics and cooperation between farmers and watershed managers

Hypothesis:

- Farmers with real-time landscape feedback can adaptively manage for:
 - “Harder-working land” - Increased average annual photosynthesis and soil aggregation
 - Improved water quality leaving the farm
 - Increased infiltration → reduced flooding
 - More economically efficient production

Growing Clean Watersheds: Needs

- Land management that keeps soil covered, grows soil aggregates and infiltrates precipitation
- Monitoring soil and water as a BMP/RAP
- Real-time environmental feedback to land managers AND communities
- Supportive non-farmers
- Supporting policy and economics
